## 1. PROJECT REPORT

**Acquisition:** Airborne Laser Scanning (ALS) data was acquired from a fixed wing aircraft between 6<sup>th</sup> to 9<sup>th</sup> July 2003. Delays in acquiring the data were due to low cloud over the project area.

**Ground Support:** GPS base station support was provided by the client without incident. The ground check points acquired by the client allowed an assessment of the accuracy of the ALS data.

**Data Processing:** Reduction of the ALS data proceeded without any significant problems. Laser strikes were classified into ground and non-ground points using a single algorithm across the project area. Manual checking and editing of the data classification against low-resolution intensity imagery created by AAM further improved the quality of the terrain model.

**Further Processing:** A local geoid model was created covering the C.C.C and Waimakariri River project areas. The geoid separation between the ellipsoidal and local orthometric heights supplied was computed with a resulting N value. The geoid model was then derived using the N value separation and compared to the International geoid model EGM96 as used by the Concord Conversion program. The EGM96 geoid model is a generalised geoid model with minor variations existing with local project areas. Graphics indicated the EGM96 model with a gentle north/south slope. This was expected, as EGM96 is an estimated geoid model with long wavelength corrections. The local geoid is similar, with what appears to be a ridgeline running in a northeast to southwest direction. The outer extents of the geoid model were then extrapolated to cover the project area. The geoid model has been supplied as a dxf file. All data supplied within this volume has been adjusted to the AAMHatch geoid model.

AAM Local Geoid Model  
0.05m Contours

A 2m gridded data set was derived from a triangulated surface model using every classified ground laser strike.

A “built layer \ canopy model” was formed from the non-ground strikes by selecting all laser strikes 2m above the ground.

The intensity value attributed each xyz laser point was used to derive a low resolution grey scaled image of the project area. Intensity data was also supplied in digital form being xyzi.

Contours have been derived at 0.5m intervals as Arc GIS 3D line strings. Due to file size limitations and steep terrain the following tiles were derived at 1m intervals. Tiles CCC182 – CCC188, CCC194 – CCC202 and CCC207 – CCC219.

Tiles CCC185, CCC186 and CCC187 have been split into north\south areas. The tile layout has been supplied in dxf format.

Note: The contours supplied on this volume are designated “GENERALISED CONTOURS” only. They are compiled from a rigorous triangulation of the supplied data with “cleaning” filter applied removing ground noise. Minimal cartographic license has been applied. They are intended to provide a visual representation of the terrain data, and are not suitable to be used as a cartographic map.

Time stamped flight path files have been provided in digital form for each flight. The time is noted as being GPS time, projection NZMG and the altitude of the aircraft being ellipsoidal heights. The GPS date is Week 1226.

Reliability polygons are supplied in dxf format in areas where the ground definition could be less accurate due to heavy vegetation and low-resolution imagery not providing enough detail during manual editing.

**Data Presentation:** The data provided on this volume has been supplied in accordance with a specification agreed with the primary client. Subsequent users experiencing difficulties in handling the data should please contact AAMHatch to arrange a more appropriate data presentation

**Further Issues:** Flight video data on VHS tape is to follow this volume.

### 3. ADDITIONAL SERVICES

AAMHatch can perform the following additional services on the data contained on this volume if required:

- Change horizontal datum : to NZTM or other local grid
- Improve data classification : by tailoring parameters to suit regional variations
- Further classification : Assist building identification by further classifying non-ground strikes
- Data subset : by dividing the data into different tiles or polygons
- Data presentation : by creating contours, profiles, perspectives, flythroughs, colour-coded height plots etc.
- Data gridding : to convert the measured spot heights into a regular grids
